

Exactly. **Neulancers shouldn't look like a normal "IT services company" website.**
The website itself should demonstrate how Neulancers thinks.

I'd build it more like a **technology studio / experimental lab / problem-solving company.**

Neulancers — Creative Website Concept

Core idea

We don't sell services. We build what shouldn't exist yet.

Neulancers becomes the place where a business problem turns into a **system, product, experiment, or intelligent machine.**

01 — Opening Screen

Very minimal.

NEULANCERS

We build things. Sometimes we don't know what they'll become.

AI. Software. Automation. Products. Experiments.

Then an interactive visual:

PROBLEM
↓
QUESTION
↓
IDEA
↓
PROTOTYPE
↓
SYSTEM
↓
SOMETHING REAL

CTA:

Bring us a problem →

Not “Contact Us.”

02 — The Problem Wall

Instead of services, immediately show **problems**.

Things we’re interested in:

What if this entire process could disappear?

Why does someone still do this manually?

Why are these five systems not talking to each other?

Can an AI actually do this instead of just answering?

What would happen if we rebuilt this from scratch?

Can this idea become a real product?

This makes the visitor think:

“These guys understand how I think.”

03 — What We’re Building

Instead of “Our Services.”

Things we’ve built / are building / are breaking

Cards continuously moving horizontally.

FINVEDA

Financial intelligence for CA firms.

LITWATCH

A system for keeping track of tax & legal matters.

MR. WATER

Turning a traditional water business into a connected operation.

AI AGENTS

Machines that don't just talk. They work.

AUTOMATION SYSTEMS

Removing repetitive work from businesses.

Each card:

PROBLEM → EXPERIMENT → BUILD → RESULT

04 — The Neulancers Method

Make this visually interesting.

We don't start with technology.

And underneath:

Technology is usually the last part of the conversation.

05 — The Lab

This could become the signature section.

N LAB

Some ideas are too early to become products. So we experiment with them.

Show experimental projects.

Current experiments

AI × Business

AI × Search

AI × Operations

AI × Knowledge

Automation × WhatsApp

Data × Decision Making

Software × Traditional Business

Each experiment can have:

STATUS

THINKING

EXPERIMENTING

PROTOTYPE

BUILDING

LIVE

This makes Neulancers feel like a **living technology company**, not an agency.

06 — The AI Section

Don't call it:

✗ AI Services

Instead:

What happens when software can think?

Then demonstrate an actual AI interaction.

For example:

You:

"Find the pending work from this week."

AI:

I've found 7 items.

3 require documents

2 require client action

1 is waiting for approval

1 is ready to close

[Take action]

Then:

We're interested in AI that doesn't stop at conversation.

Talk → Think → Act

That becomes a Neulancers philosophy.

07 — Behind the Build

Show the engineering side.

Under the hood

Not a giant technology logo wall.

Instead:

Python

Django

APIs

AI

Automation

Data

Infrastructure

Then:

We use whatever technology solves the problem.

Small text:

Open source. Cloud. Local AI. APIs. Automation. Custom software.

08 — The People

Avoid:

“Our highly skilled team...”

Instead:

Small team. Big curiosity.

Show people with strange/simple descriptions:

ENGINEER

Turns ideas into systems.

BUILDER

Makes prototypes real.

DESIGNER

Makes complicated things feel simple.

RESEARCHER

Asks inconvenient questions.

Could even show:

We're not hiring job titles. We're looking for people who like figuring things out.

09 — The Internet Is Full of Software

A strong philosophical section.

There are already thousands of tools.

We don't need another one.

Unless it solves something differently.

Then:

That's where we come in.

This separates Neulancers from the "we build websites/apps" crowd.

10 — Journal / Experiments

Instead of generic **Blog**.

Call it:

LAB NOTES

Examples:

We tried building an AI agent that actually does the work.

What happened when we connected WhatsApp to an ERP?

Why we're experimenting with local AI.

We rebuilt a business workflow from zero.

What we learned building Finveda.

Can traditional businesses become software companies?

This can become both **content marketing + brand building**.

11 — Final CTA

Don't end with:

"Contact us for your software requirements."

Instead:

Got a strange problem?

Good.

We like those.

Tell us what you're trying to solve →

Small text:

You don't need a specification.
You don't need a technical document.
Just tell us what isn't working.

Visual Direction

I'd make the entire site feel like a **digital laboratory**.

Design language

- Black / off-white base
- Huge typography
- Monospace technical text
- Thin borders
- Grid system
- Experimental animations
- Cursor interactions
- Scrolling system diagrams
- Terminal-like micro interactions
- Lots of negative space
- Occasional unexpected visuals

Not:

- ✗ Stock photos
 - ✗ Corporate people shaking hands
 - ✗ "Our Mission / Vision / Values" blocks
 - ✗ 20 service cards
 - ✗ Generic technology logos
 - ✗ "Trusted by 100+ clients" unless genuinely meaningful
-

The Brand Narrative

The whole website could tell one story:

Businesses have problems.

We ask better questions.

We experiment.

We build.

We connect technology to the real world.

Something new exists.

And that becomes the identity of Neulancers.

Possible homepage headline directions

01 — Bold

We Build What Comes Next.

02 — More mysterious

Something Is Being Built Here.

03 — Problem-focused

Bring Us Your Impossible Problem.

04 — Founder/engineering feel

Think. Experiment. Build.

05 — AI era

Software Is Changing. So Are We.

06 — My preferred direction

We Don't Build Software. We Build Possibilities.

That last one gives you much more room for **AI, products, experiments, software, automation and future ventures** without turning Neulancers into another agency website.
